## Description

I built my project because I recently went vegetarian and I love to eat out. My project lists local restaurants that offer vegetarian menu options. Having this information in one convenient place makes deciding on a healthy and cruelty-free dining choice, quick and easy.

## Features

- Users can sign in
- Users can view a list of restaurants with name and address
- Users have the ability to add new restaurants to the list

## Planning - User Stories

As a vegetarian, I want a single place that lists vegetarian friendly restaurants to be able to decide where to eat faster and easier

As an authorized user, I want to add restaurants to the database

## Technology Stack

- C#
- ASP.net
- Visual Studio
- MySQLworkbench

## What's Next

- I am working to learn how to create roles for users (i.e. admin)
- I would also like to add a photo of the restaurant and make the UI more visually appealing
- I will also continue to add a features where users to sort by cuisine type, save restaurants they would like to try, make notes for themselves on restaurants they have tried, and leave public reviews.
